

Nitrates

Most commonly found in rural and private water supplies, nitrate contamination can cause serious health problems; especially among infants, young children and expectant mothers. A condition commonly known as “Blue Baby Syndrome” can occur in young children as a result of the intake of nitrates.

The most common sources are agriculture fertilisers, livestock manure and waste from septic tanks. Nitrate is soluble in water and can soak quickly into the ground waters; especially after heavy rainfalls. Nitrate has no taste or odour and if you suspect a nitrate contamination it is advisable to get an accurate water analysis and contact your Local health authority. We would be happy to assist and advise you.

Problems Caused by Nitrates

- Severe health problems for infants, young children and expectant mothers
- Blue Baby Syndrome is a common condition

Solution: Nitrate Filters

- A simple and efficient method is the use of nitrate filters.

Benefits of Iron Filters

- Purified, clean healthy water
